Endocrine Disorders: Types, Causes, Symptoms, and Treatments

Endocrine glands are ductless glands of the endocrine system that secrete their products, hormones, directly into the blood. The major glands of the endocrine system include the pineal gland, pituitary gland, pancreas, ovaries, testes, thyroid gland, parathyroid gland, hypothalamus and adrenal glands. The hypothalamus and pituitary glands are neuroendocrine organs.

Endocrine gland - Wikipedia

The glands of the endocrine system send out hormones that tell each part of your body what work to do, when to do it, and for how long. Hormones are vital to your health and well-being. Hormones are your body's chemical messengers. They travel in your bloodstream to tissues or organs to help them do their work.

Your Health and Hormones | Hormone Health Network

The endocrine system is a tightly regulated system that keeps the hormones and their effects at just the right level. One way this is achieved is through 'feedback loops'. The release of hormones is regulated by other hormones, proteins or neuronal signals. The released hormone then has its effect on other organs.

Hormonal (endocrine) system - Better Health Channel

Hormones and the Endocrine System As described in the Diseases Overview section, the adrenal glands produce hormones that are directly or indirectly involved in most major bodily functions. After

spay/neuter, the adrenal glands must take on the additional burden of producing sex hormones to compensate for the loss of the reproductive organs.

Hormones and the Endocrine System - Healthy and Happy Dog

Immune System regulation Characteristics The endocrine system is composed of endocrine glands and specialized endocrine cells located throughout the body. Endocrine glands and cells secrete minute amounts of chemical messengers called hormones into the bloodstream, rather than into a duct.
