ACUTE SPINAL CORD INJURY MANAGEMENT SUMMARY Acute spinal cord injury is a life-altering event. Spinal cord injury management should be multidisciplinary. Early management should incorporate a full Advanced Trauma Life Support (ATLS) assessment with the intent to avoid hypotension, bradycardia, and hypoxia.

Spinal Stenosis Treatment & Management: Approach ...

Imaging of the spine is an essential part of the initial management of acute SCI; plain X-rays or computed tomography form the basis of standard trauma protocols and can identify most fractures and ligamentous injuries. 28 These imaging modalities, however, cannot visualize the spinal cord or the surrounding soft tissues to the same degree as MRI. 29 The potential benefits of MRI in the setting of acute SCI are that this type of imaging can identify ongoing spinal cord

compression; depict ...

Nonsteroidal anti-inflammatory drugs, alone or in combination with muscle relaxants, relieve pain and improve overall symptoms of acute low back pain. Exercise therapy has limited value for acute low back pain, but strong evidence supports exercise therapy in the management of chronic low back pain.

"The strongest trial was one that I had led known as the STASCIS trial [Surgical Timing in Acute Spinal Cord Injury Study]," which found significantly improved neurologic recovery and no difference in complication rates with early (≤ 24 hours) versus late (> 24 hours) decompression after cervical SCI," Dr. Fehlings told SpineUniverse. 1 "This was a prospective cohort, comparative effectiveness study, but was not randomized."

fractures before introduction of the Harrington internal fixation system in the 1960s was limited to laminectomy and often associated with neurological deterioration secondary to spinal cord manipulation or increased instability. ³ However, the success of surgical treatment of thoracic fractures has grown in parallel with technologic advancements in spinal instrumentation.

In acute SCI patients, the choice of the surgical procedure is a function of the objective of the surgery; fixation of instability and decompression of the spinal cord. The choice of one procedure or another is a function of the severity of injury, the level of injury, the mechanism of injury, and the location and the extent of compression.

Acute spinal cord compression (ASCC) is a surgical emergency requiring immediate neurosurgical treatment. Prognosis of the condition can vary and is most dependent on the time between diagnosis and treatment. In this article, we shall look at the risk factors, clinical features and management of acute spinal cord compression.

The management of acute SCI requires significant health care resources and can place substantial financial burden on patients, their families, and the community. These costs are associated with a need for high-level acute care in the short term along with complication management in the long term.

A spinal cord injury (SCI) is defined as damage to the spinal cord caused by an insult resulting in the transient or permanent loss of usual spinal motor, sensory, and autonomic function. This article outlines the initial management of acute traumatic spinal cord injuries in adults.

Management of spinal stenosis is aimed toward symptomatic relief and prevention of neurologic sequelae. Conservative measures such as pharmacologic therapy and physical therapy provide temporary relief but remain an important adjunct in the overall treatment algorithm preceding surgical decompression.
